

In the plate 2, the groove on which the ball moves is, for example, an "ellipse". These two movements: rectilinear in the disk and curvilinear in the plate provides the desired position of the balls, which allows you to get a moment from the mass of the balls with the right more than the left, which creates a torque on the shaft 3. In the model, the number of balls is taken at a minimum, three, their number needs to be increased - this will give a more uniform movement to the shaft 3. The power set will be convenient only by increasing the number of disks 1 installed on one shaft 3 by placing the disks 1 relative to each other on the shaft 3 with mixing by an angle multiple of the number of disks.

This wheel is most conveniently used in the mechanisms working with constant revolutions - pumps, generators.

### RESUME

The article proposes the determination of the parameters (length, width, height) of the useful volume of the hopper for the preparation of dry loose crustaceans with a forage mixer.
